

As an avid Ham radio operator and short wave listener, I can't believe that anyone associated with spectrum allocations could support transmission of broad band internet signal over power lines. Power lines radiate radio waves! They are equivalent to long wire antennas. I have serious noise problems from the local power lines because of poor power company maintenance. Now their proposing to add broad band internet transmission on these lines. Please stop this, common sense says this will be a disaster to the Amateur radio and shortwave listener community.
